PROBLEM STATEMENT

1) Statistically, we have seen a lot of students pursue their education away from their native countries. Generally as the students don't have much of an idea about the procedures, requirements and details of the universities, they seek help from the education consultancy firms to help them successfully secure the admission in the universities which are best suitable for their profiles. For this, they have to invest huge amount of money as consultancy fees.

2) UNIVERSITY PREDICTION would be the easiest mode to predict the university/colleges person is applicable for as well as it would unbiased and totally transparent. Individually would no more need to depend upon the consultancies who may be slightly deviated towards the list of colleges/university that may be having contract with them. More over applying to only that colleges/university where the student has genuine chance would even reduce application process.

3) The aim of this project is to develop a system to predict the admission chance of student using machine learning algorithm.
